Open Data

“A piece of data or content is open if anyone is free to use, reuse, and redistribute it [...]”
[opendefinition.org]

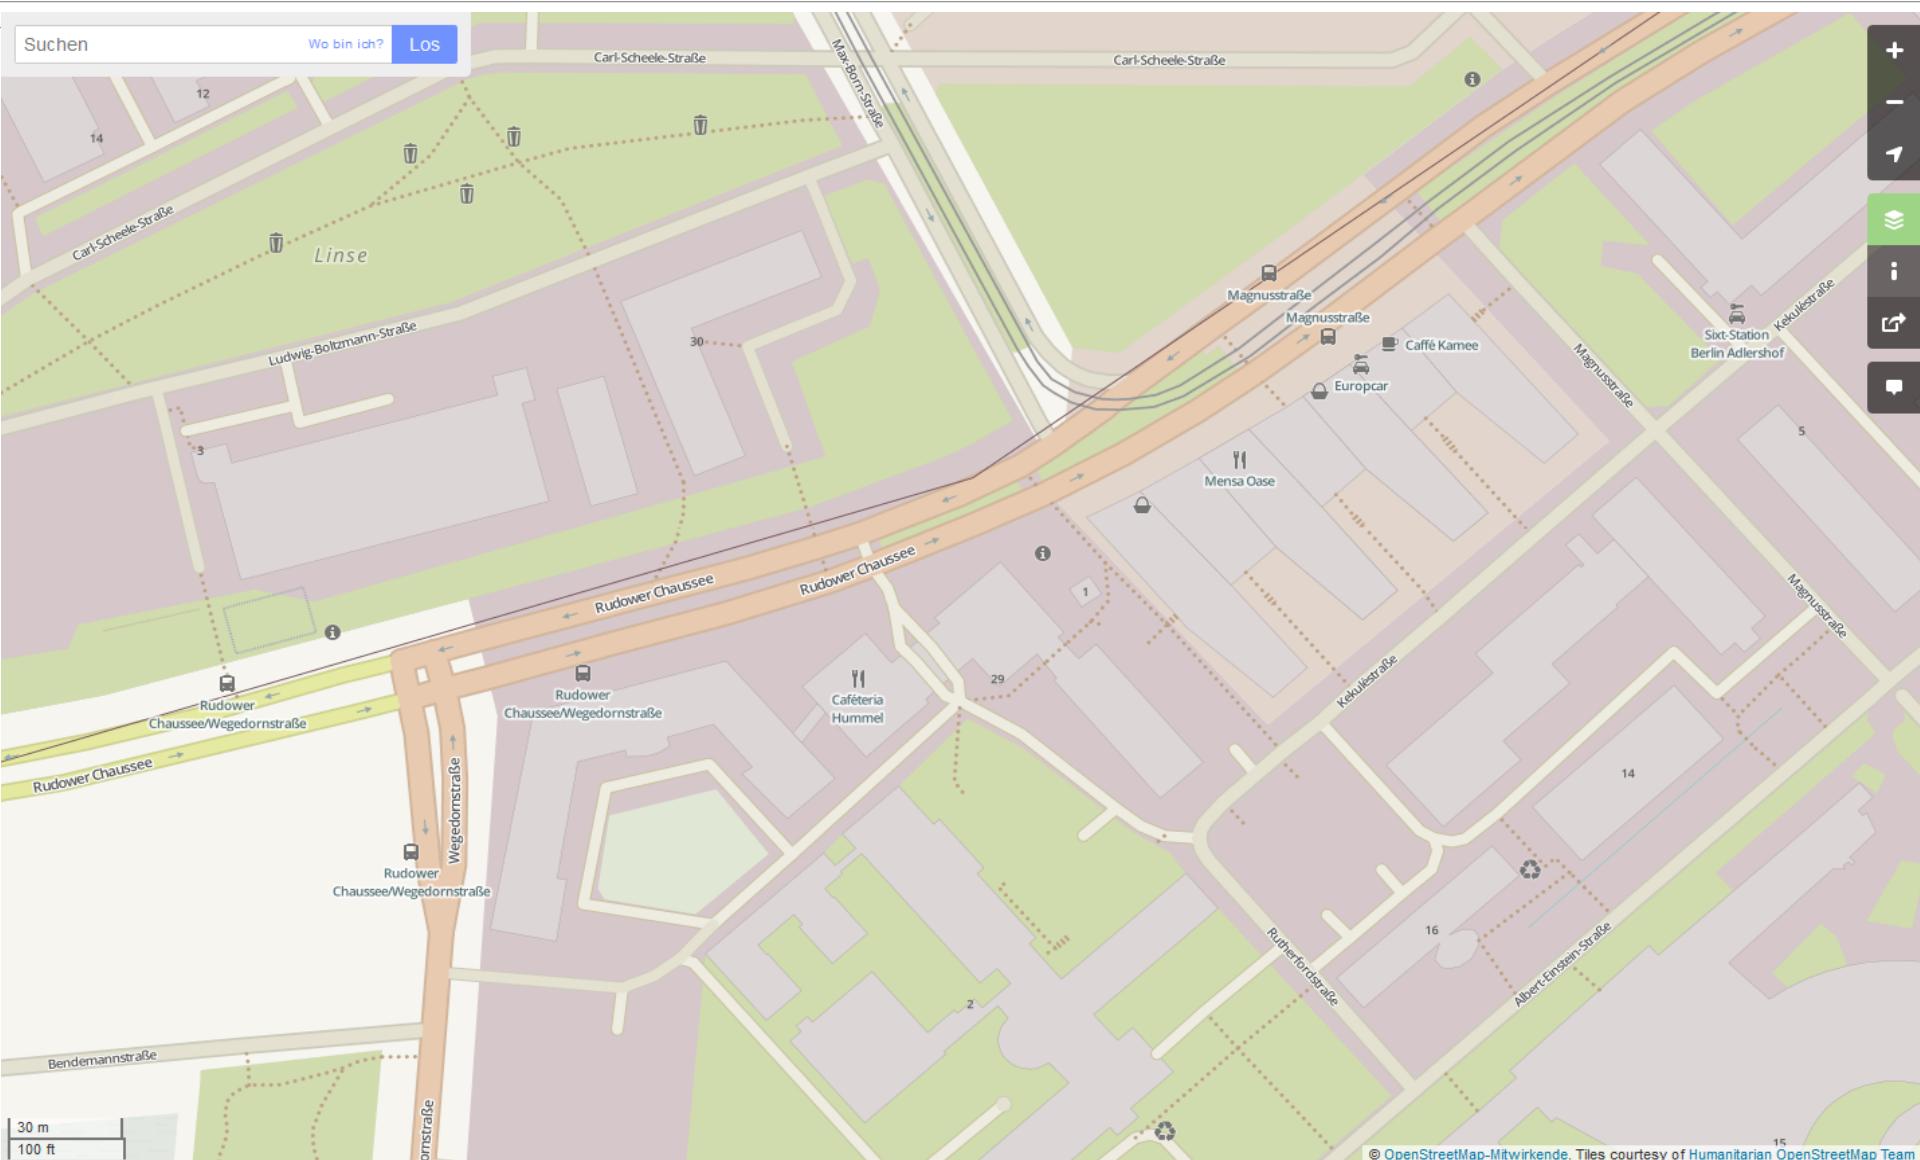

Open data is the idea that certain data should be freely available to everyone to use and republish as they wish, without restrictions from copyright, patents or other mechanisms of control. [Wikipedia.org]

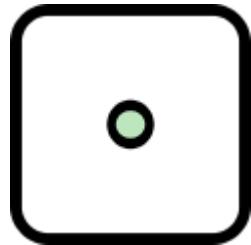

OpenStreetMap, the project that creates and distributes free geographic data for the world

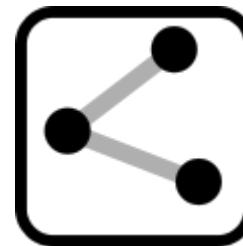

Source: openstreetmap.org

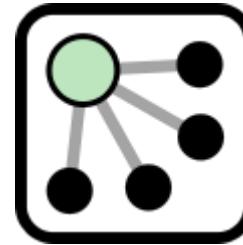

NODE

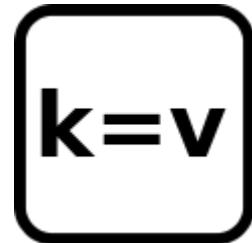

WAY

AREA

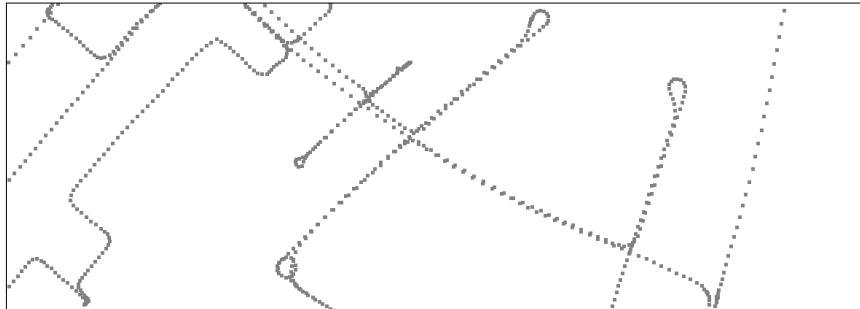

RELATION

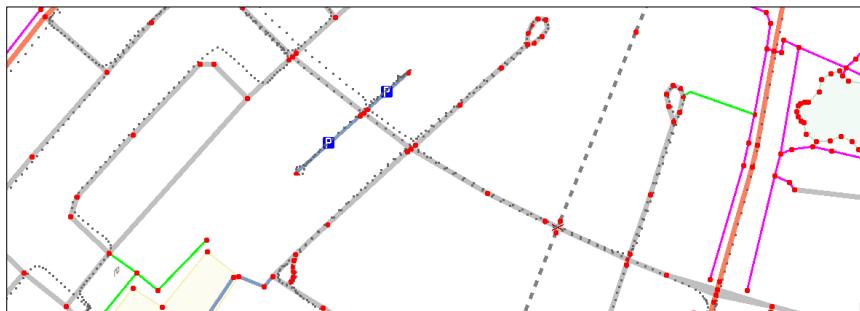

KEY & VALUE

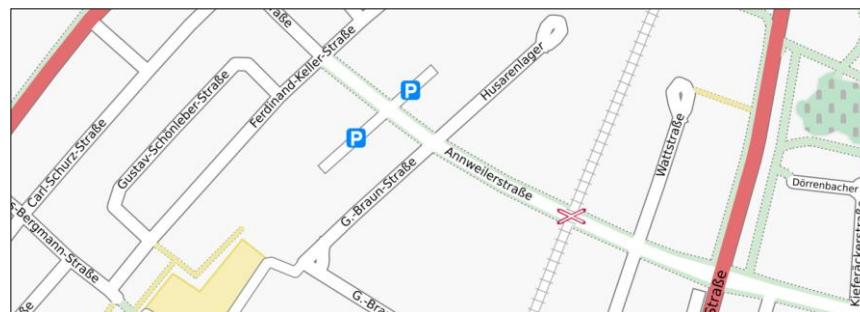

Key	Value	Element	Comment	Rendering	Photo
Track					
railway	rail		Full sized passenger or freight trains in the standard gauge for the country or state		
railway	tram		One or two carriage rail vehicles, usually sharing motor road (Other languages )		
railway	light_rail		A higher-standard tram system, normally in its own right-of-way. Often it connects towns and thus reaches a considerable length (tens of kilometer).		

**Import of GPS traces
(Track, GPX file)**

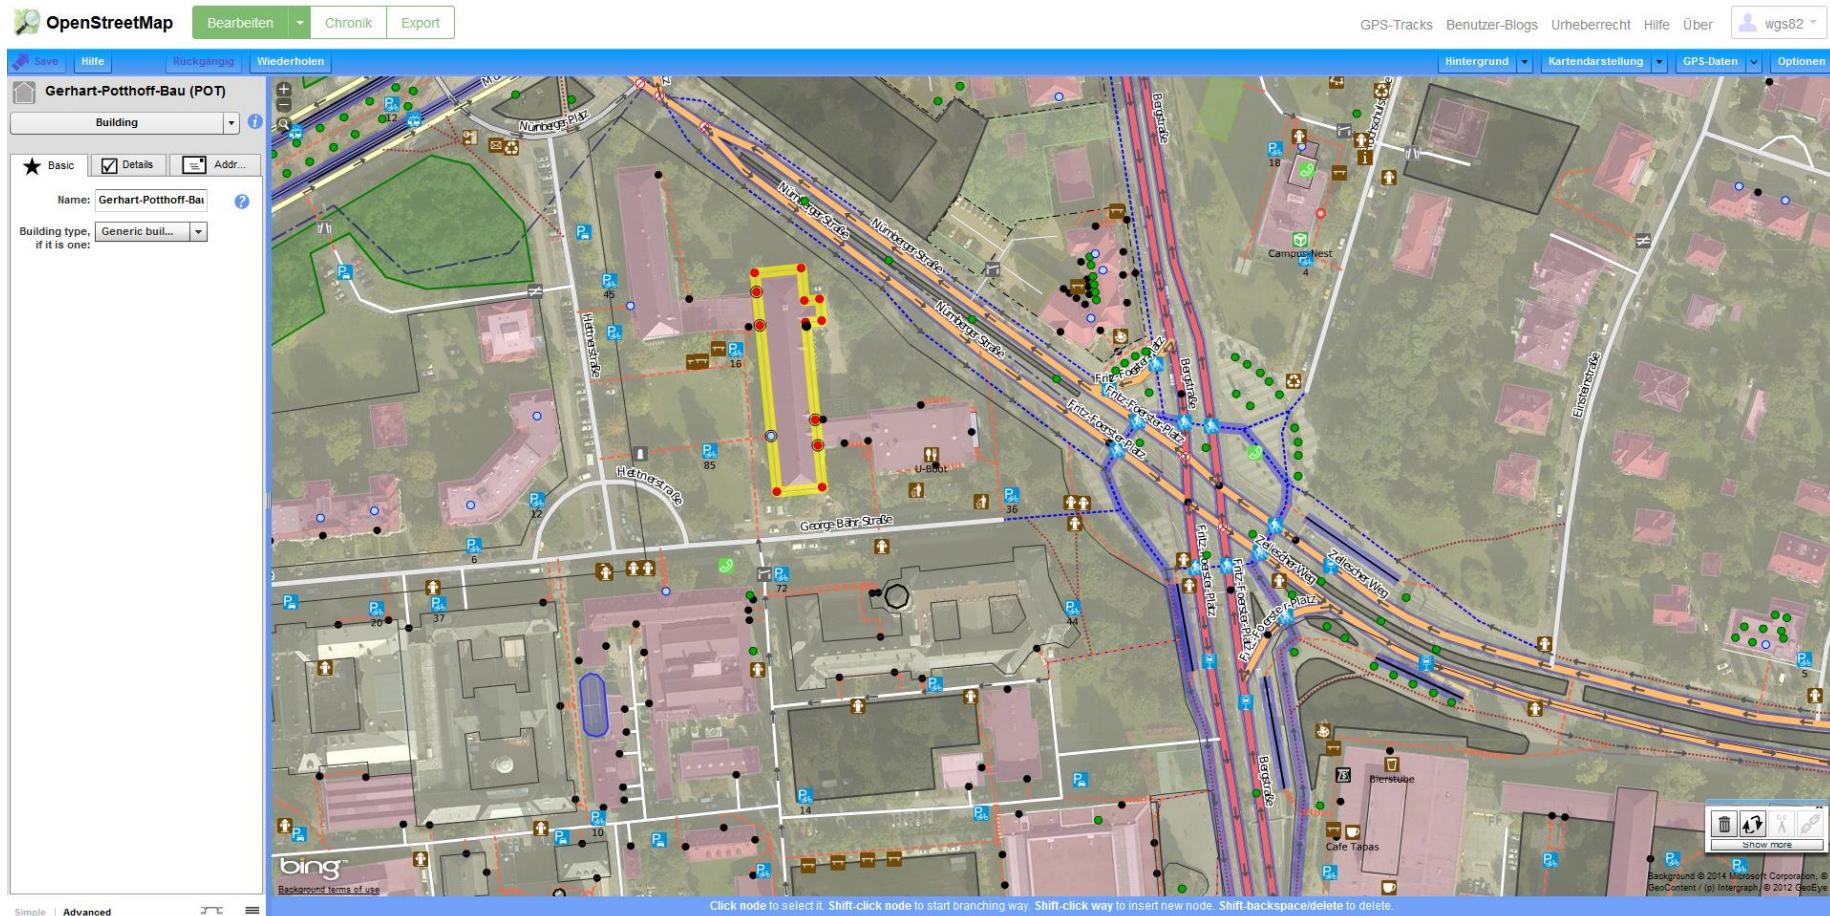

**Add additional information
to the recorded tracks**

**Rendering the geospatial
data and publish it to a WMS**

Open Modeling Tools

- Offline editor for OSM data
- Direct upload to OSM server possible

<https://josm.openstreetmap.de>

Osmosis is a command line Java application for processing OSM data. The tool consists of pluggable components that can be chained to perform a larger operation. For example, it has components for reading/writing databases and files, deriving/applying changes to data sources, and sorting data, (etc.). It has been written to easily add new features without re-writing common tasks such as file and database handling.

Some examples of the things it can currently do are:

- Generate planet dumps from a database
- Load planet dumps into a database
- Produce change sets using database history tables
- Apply change sets to a local database
- Compare two planet dump files and produce a change set
- Re-sort the data contained in planet dump files
- Extract data inside a bounding box or polygon

Osmosis can also be included as a library in other Java applications.^[1]

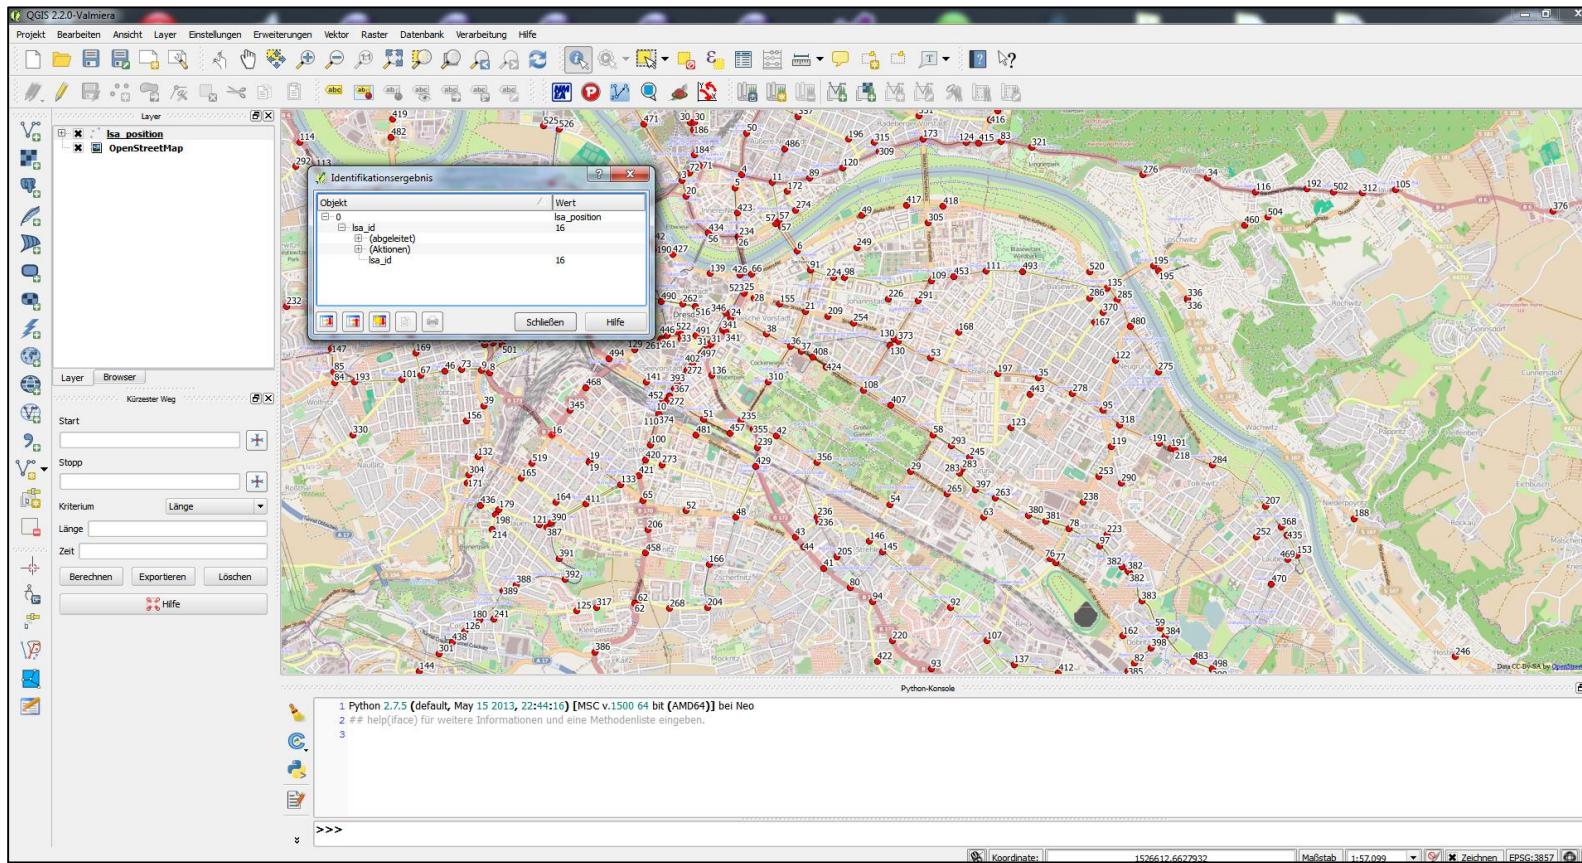

```
osmosis --read-xml city.osm --tf accept-ways highway=* --used-node --write-xml highways.osm
```

```
osmosis --read-apidb host="x" database="x" user="x" password="x" --write-xml file="planet.osm"
```

<http://wiki.openstreetmap.org/wiki/Osmosis.openstreetmap.de>

- Free editor/viewer for GIS data
- Python extensions available

<http://www.qgis.org>

- Java Library for GIS operations (queries, matching, projection, ...)
- Reading/writing of different GIS formats (Shape, Postgis, Spatialite, KML, ...)

The screenshot shows the official website for GeoTools at <http://www.geotools.org>. The page features a large logo for "GeoTools" with a compass icon, and a smaller "OSGeo Project" logo. Navigation links include Documentation, Downloads, Wiki, About, and Blog. The main content area is titled "GeoTools The Open Source Java GIS Toolkit" and describes it as an open source Java library for geospatial data. It includes links for Quickstart, Documentation, Get Involved, and About GeoTools, each accompanied by a small icon. To the right, there's a "News" section with three entries: "GeoTools 10.6 Released" (published on 2014-4-15), "GeoTools 11.0 released" (published on 2014-3-20), and "GeoTools 11-RC2 released" (published on 2014-3-4). Logos for SourceForge.net, YourKit Profiler, and java.net are displayed at the bottom right.

<http://www.geotools.org>

PostGIS adds extra types (geometry, geography, raster and others) to the [PostgreSQL](#) database. It also adds functions and indexes that apply to those types. It does this by:

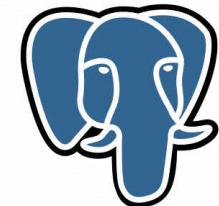

- Building a C library that PostgreSQL can load into a `postgres` backend.
- Binding the functions and structures in that library to SQL types and functions.

Since PostGIS is in C, it can make use of other libraries in C, and it does so liberally. PostGIS depends on:

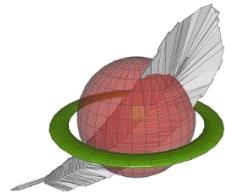

- [GEOS](#) for many geometry processing algorithms
- [Proj.4](#) for coordinate re-projection functions
- [GDAL](#) for raster processing and format support
- [LibXML2](#) for XML parsing
- [JSON-C](#) for JSON parsing

PostgreSQL

- Spatial extension of SQLite
- Very fast

SpatiaLite is an **open source** library intended to extend the [SQLite](#) core to support fully fledged Spatial SQL capabilities. SQLite is intrinsically simple and lightweight:

- a single lightweight library implementing the full SQL engine
- standard SQL implementation: almost complete SQL-92
- no complex client/server architecture
- a whole database simply corresponds to a single monolithic file (no size limits)
- any DB-file can be safely exchanged across different platforms, because the internal architecture is universally portable
- no installation, no configuration

SpatiaLite is smoothly integrated into SQLite to provide a complete and powerful Spatial DBMS (mostly OGC-SFS compliant).

Using SQLite + SpatiaLite you can effectively deploy an alternative *open source* Spatial DBMS roughly equivalent to [PostgreSQL](#) + [PostGIS](#).

SpatiaLite is licensed under the [MPL tri-license](#) terms; you are free to choose the best-fit license between:

- the [MPL 1.1](#)
- the [GPL v2.0](#) or any subsequent version
- the [LGPL v2.1](#) or any subsequent version

Live Example

Example: San Francisco

OpenStreetMap Data Extracts

 **New site layout** - we've tried to make it so that any old saved links still work; do tell us if there's a problem!

Welcome to Geofabrik's free download server. This server has data extracts from the [OpenStreetMap project](#) which are normally updated every day. Select your continent and then your country of interest from the list below. (If you have been directed to this page from elsewhere and are not familiar with OpenStreetMap, we highly recommend that you read up on OSM before you use the data.) This download service is offered for free by Geofabrik GmbH.

 **Neue Webseiten-Struktur** - Alle alten gespeicherten Links sollten aber trotzdem noch funktionieren.

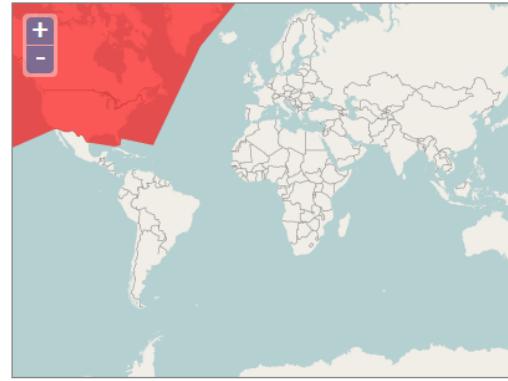

Willkommen auf dem Geofabrik-Downloadserver. Hier gibt es Daten-Auszüge aus dem [OpenStreetMap-Projekt](#), die normalerweise täglich aktualisiert werden. Wählen Sie aus dem Verzeichnis unten den Kontinent und ggf. das Land, für die Sie Daten benötigen. (Wenn Sie von anderswo auf dieser Seite gelandet sind und von OpenStreetMap nichts wissen, dann ist es empfehlenswert, sich mit dem Projekt vertraut zu machen, bevor Sie mit den Daten arbeiten.) Diese Downloads werden von der Geofabrik GmbH kostenlos angeboten.

Click on the region name to see the overview page for that region, or select one of the file extension links for quick access.

Sub-Region	Quick Links

```
<?xml version="1.0" encoding="UTF-8"?>

<additional xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:noNamespaceSchemaLocation="http://sumo-sim.org/xsd/additional_file.xsd">
  <poly id="100136731" type="sport.basketball" color="51,128,255" fill="1" layer="-1.00" shape="4857.71,5616.04 4858.61,5600.61 4886.26,5602.20 4885.36,5617.63 4857.71,5616.04"/>
  <poly id="100136733" type="sport.tennis" color="51,128,255" fill="1" layer="-1.00" shape="4838.80,5652.45 4840.64,5616.97 4886.44,5619.32 4884.60,5654.82 4838.80,5652.45"/>
```

Improvements:

- copy content from OSM file to a spatial database e.g. Spatialite
- use SQL queries for the geometries
- write polygon XML file (e.g. DOM4J)
- decide the necessary accuracy level

Add elevation data:

- download GeoTiff (image with embedded geographical/elevation data)
- Mapmatching with existing network

 FAQs

Welcome to the Traffic Data Branch

The Traffic Data Branch is responsible for the collection and dissemination of historical volumes (counts). We also produce the [Mobility Performance Reports](#).

TRAFFIC COUNTS, also called Traffic Volumes, are available in various formats, and are only for the State Highway System. Highways are signed as Interstate, California State Route, or United States Route. See examples below.

Traffic count information for city and county streets may be found at the following links. Click [HERE](#) for city traffic volume information. County traffic volume information is available at the [County](#) Public Works Department, or the Community Development Office in the area where the street is located.

[Explanatory Diagram of Traffic Counts \(.pdf\)](#)

Caltrans traffic counts are summarized annually into three categories. Necessary software to download .pdf files can be obtained for free by clicking on the desired link in the grey column on the right side of this page:

1. **Traffic Volumes** (Annual Average Daily Traffic (AADT)) for all vehicles on California State Highways: [2011](#), [2012](#)
 For PDF format, click on the following: [2011 Traffic Volumes Book](#), [2012 Traffic Volumes Book](#)
 This data is also available in Excel format: [2011AADT](#), [2012AADT](#)
2. **Truck Traffic** (Annual Average Daily Truck Traffic on California State Highways).
 For PDF format, click on the following: [2010 pdf](#), [2011 pdf](#), [2012 pdf](#)
 The 2011 Truck report is also available in Word format: [2011Truckdoc](#), [2012Trucdoc](#)
 Truck traffic data is also available in Excel format: [2010Truck](#), [2011Truck](#), [2012Truck](#)
3. **Ramp Volumes** on California State Freeways. For downloadable PDF files (organized by Caltrans Districts 1 through 12), click on the following link: [2012](#)
4. **Peak Hour Volume Data** consists of hourly volume relationships and traffic monitoring sites on the State Highway System.
 Morning (AM) and evening (PM) peak periods are expressed as a percentage of Annual Average Daily Traffic (AADT).
 Peak Hour reports are available in PDF format: [2008](#), [2009](#), [2010](#), [2011](#), [2012](#)

» [FHWA OFFICE OF TRAVEL MONITORING](#)

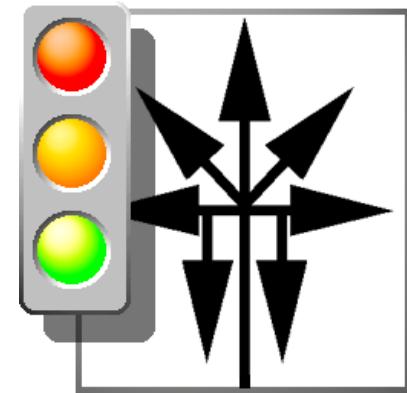

The publications and reports on this site that are labeled .pdf (portable document format) require Adobe Acrobat Reader to view them. The software can be downloaded free from Adobe's web site (one-time setup).

Click on the link below to go to the site.

Dist	Route	County	Postmile	Description	Back	Back	Ahead	Ahead
